                                               Human TIE-2 (tyrosine kinase with Ig and EGF homology domains) ligand 2 (AAW01411) is a ligand that binds the TIE-2 receptor. amino acid sequence was deduced from a cDNA clone (AAT44321) defrom human foetal lung cells. TIE-2 ligand 2 is a receptor antagonist useful for blocking blood vessel growth, for tumour therapy and for treating a proliferative disorder of a blood-forming crgan. It can be obtd. from natural sources or express in transformed host cells.

The present invention relates to anti-Vascular Endothelial Growth Factor (VEGF) antibodies that bind to the same epitope as the monoclonal antibody ATCC PTA 1595 and which significantly inhibit VEGF binding to the VEGF receptor VEGFR2, without inhibiting VEGF binding to the VEGF receptor VEGFR1. The present sequence is human angiopoietin-2. Angiopoietin-2 may be operatively attached to the anti-VEGF antibodies of the present invention. Angiopoietin-2 acts to disturb capillary structure and is thought to lead to vessel regression. The anti-VEGF antibodies of TABQTRKLTDVEAGVENGTTRLEEQLLEHSLSTNKLEKQILDQTSEINKLQDKNSFLEKK LEDFNGVELYALY DQFYVANEFLKYRLHVGNYNGTAGDALRFNKHYNHOLKFFTTPDKDN VNSLDGKCSKCPSQEQIQSRPVQHLIYKDCSDYYAIGKRSSETYRVTPDPKNSSFEVYCD Immunogenic composition for the treatment and diagnosis of cancer comprises an anti-VEGF (vascular endothelial growth factor) antibody binding the same epitope as the monoclonal antibody ATCC PTA 1595 -Human, angiopoietin-2; cytostatic; antiproliferative; vascular endothelial growth factor; VEGF; antibody; VEGF2 ablood vessel regression; cancer; vascularised solid tumour. - NMNNI ENYVDSKVANLT Disciosure; Page 283-285; 298pp; English 496 437 496 standard; Protein; 2000WO-US11367 entry) SSFKEAKMIRPKHF - SLKATTMMIRPADF Brekken RA; Human angiopoietin-2 (first WPI; 2000-687317/67 N-PSDB; AAC67774. The nucleic acids, vecto and host cells used in the method of the invention are useful for the recombinant production of the ligands. The ligands, etc. are useful for blocking blood vessel growth, promoting neovascularisa promoting the growth or differentiation of a cell expressing the receptor, blocking the growth or differentiation of a cell expressing the TIE receptor and for attenuating or preventing tumcur growth DRYPSGNCGLYYSSGWWFDACLSANLNGKYYHCKYRGVR-NGIFWGTWPGVSEA - OTAVMIEIG 124; for promoting --NKLSSELKNAKEEINVLHGR ligand 2N1CiF; TIE-2 ligand; neovascularisation; Length 496; LKDWEGNEAYSLYEHFYLSSEELNYRIHLKGLIGTAGKISSISQPGND-Indels useful Score 522; DB 19; Pred. This sequence represents the human angiopoietin-2 (Ang-2) amino acid sequence. Ang-2 is a naturally occurring angiogenesis antagonist when vascular endothelial growth factor (VEGF) levels are low, and generally counteracts the blood vessel maturation and stability mediated by Ang-1.

Ang-1 is a naturally occurring angiogenesis agonist, and is a maturation of stabilisation factor, converting immature vessels to mature vessels.

Contement of vascularised tumours. The invention relates to a binding ligand comprising a targeting agent that binds to an aminophospholipid, linked to a therapeutic agent (e.g. Ang-2). Aminophospholipids are stable and specific markers accessible on the luminal surface of tumour blood vessels. The binding ligand induces coagulation (thrombosis) in tumour vasculature or causes tumour necrosis (possibly by cell- or complement-mediated cytotoxicity and/or apoptosis). The binding ligands are used to treat vascularised tumours, malignant or benign, in animals, especially large tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5

                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the human angiopoietin-2 (Ang-2) amino acid sequence. Ang-2 is a naturally occurring angiogenesis antagonist when vascular endothelial growth factor (VEGF) levels are low, and generally counteracts the blood vessel maturation and stability mediated by Ang-1.

Ang-1 is a naturally occurring angiogenesis agonist, and is a maturation or stabilisation factor, converting immature vessels to mature vessels.

Both Ang-1 and Ang-2 are useful in a therapeutic approach to the treatment of vascularised tumcurs. The invention relates to a composition composition is used to kill tumcur vasculature endothelial cells. Aminophospholipids are stable and specific markers accessible on the luminal surface of tumcur blood vessels. Ang-1 or Ang-2 may be used in the composition of the invention. The composition is used to treat malignant or benign vascularised tumcurs in animals, especially large

of the invention are useful in therapy, and diagnosis, for inhibiting angiogenesis in an animal having ocular neovascular disease or macular degeneration, and for delivering a biological agent to a vascularised tumour. The compositions can also be used for treating cancer and subjects at risk of developing, a vascularised solid tumour, a metastasic tumour or metastases from a primary tumour. The composition is useful for specifically inhibiting VEGF-induced endothelial cell proliferation, without significantly inhibiting VEGF-induced macrophage, osteoclast or chondroclast function. The compositions can be used for treating various diseases such as inflammatory disorders, atherosclerosis, diabetic retinopathy, restenosis, acquired immune deficiency syndrome (AIDS), blood borne tumours, corneal graft rejection, Crohn's disease, fungal culcers, infections, sickle cell anaemia, and endometriosis. The present sequence represents human angiopoietin-2. Angiopoietin-2 may be attached cor functionally associated with anti-VEGF antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                          13

The invention describes a method of identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. The method composition in the presence and in the absence of a putative modulator compound, and detecting the binding between Tie receptor and the Ephrin in the presence and in the absence of the putative modulator. The method in the presence and in the absence of the putative modulator. The method is useful for identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. Modulators identified from the method are useful in modulating angiogenic processes, including lymphangiogenesis, for treating diseases associated with aberrant Ephrin-Tie biology, aberrant growth, migration or proliferation of celis that express a Tie receptor, or for promoting growth of vessel or neovascularisation (e.g. ischaemic tissue, an infarction, a new or chronic compound, or a tissue graft or transplant). This is the amino acid sequence of human angiopoietin 2 (ang-2), a Tie-2 tyrosine receptor with a tie-2 tyrosine receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              --TIQ--LPKQFSRIEEVFKEVQN

The invention provides a non-viral vesicle vector for the delivery of nucleic acid to various cardiac cell types.

The vesicle vector contains the hepatitis B virus envelope protein in which at least part of the liver targetting sequence is deleted and replaced with a specific cardiac cell targetting sequence. For example, to selectively target vascular endothelial cells, peptides including angiopoietin-2 are used. The vesicle vector can be delivered intravenously or intra-arterially rather than by more invasive methods such as direct cardiac injection. It can be used to invasive methods such as direct cardiac injection of the for treatment of heart failure, arrhythmia, reperfusion of proteins for treatment of heart failure, arrhythmia, reperfusion of injury, atherosclerosis, to promote angiogenesis, etc. The vesicles injury, atherosclerosis, to promote angiogenesis, etc. The vesicles them ideal for the produced in large quantities, making

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colymerase chain reaction (PCR) primers, cligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and of (II) are useful in medical disorders involving aberrant protein expression of biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

C amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO. The type of the produces.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags of the identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving an expressing (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression of mutations of agenetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of the chimeric TIE ligand iNIC2F, used in the method of the invention, involving the production of TIE-2 ligands which promote healing. The nucleic acids, vectors and host cells used in the method of the invention are useful for the recombinant production of the ligands. The ligands, etc. are useful for blocking blood vessel growth, promoting neovascularisation, promoting the growth or differentiation of a cell expressing the TIE receptor, blocking the growth or differentiation of a cell expressing the TIE receptor and for attenuating or preventing tumour growth in

Sequence 4, Application US/09442143A

Patent No. 6403089

GENERAL INFORMATION:

APPLICANT: Clark, David A.

TILE OF INVENTION: Methods of Modulating Immune Coartine Reference: 9579-14

CURRENT APPLICATION NUMBER: US/09/442,143A

CURRENT FILING DATE: 1999-11-15

PRIOR APPLICATION NUMBER: US 60/061,684

PRIOR FILING DATE: 1997-05-17

PRIOR FILING DATE: 1997-10-10

NUMBER OF SEQ ID NOS: 53

SOFTWARE: Patentin version 3.1

-!- FUNCTION: Extracellular matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebellum.

Regulates microtubule function in neurons and neuronal migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoER2 induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation (By similarity).

-!- SUBUNIT: Binds to the ectodomains of VLDLR and ApoER2 (By

 Isoid=P78509-3; Sequence=VSP_005576; TISSUE SPECIFICITY: Abundantly_produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum. In adult brain, preferentially expressed in GABAergic interneurons of prefrontal cortices, temporal cortex, hippocampus and glutamatergic granule cells of cerebellum. Also expressed in fetal and adult liver. DEVELOPMENTAL STAGE: Expressed in fetal and postnatal brain and liver. Expression in postnatal human brain is high in the cerebellum.

 Similarity).

DISEASE: Defects in REIN are the cause of autosomal recessive lissencephaly with cerebelar hypoplasia (Also known as Norman-Roberts syndrome). Some patients also displayed persistent lymphedema neonatally, and one showed accumulation of chlycus (i.e., fatty) ascites fluid.

DISEASE: Defects in REIN may contribute to susceptibility to schizophrenia. Expression of the protein is reduced (about 50% patients with schizophrenia.

DISEASE: Defects in REIN may predispose to autistic disorder.

DISEASE: Defects in REIN may predispose to autistic disorder.
 Q
in RELN may predispose to autistic disorde triplet repeat located in the 5'UTR region in the normal population is significantly

"Reelin controls position of autonomic neurons in the spinal cord.";

"Reelin controls position of autonomic neurons and rerebellum.

"Proc. Natl. Acad. Sci. U.S.A. 97:8612-8616(2000).

-!- FUNCTION: Extracellular matrix serine protease that plays a role in layering of neurons in the cerebral cortex and cerebellum.

Regulates microtubule function in neurons and neuronal migration of sympathetic preganglionic neuronal in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoER2 induces tyrosine phosphorylation of Dab1 and modulation of Tau phosphorylation.

-!- SUBUNIT: Binds to the ectodomains of VLDLR and ApoER2.

-!- ALTERNATIVE PRODUCTS:

The present invention describes a composition (I) comprising an isolated reelin protein (II) bound to an isolated low density lipoprotein creceptor (LDLR) (III). (II) is an extracellular glycoprotein of approximately 385 kDa containing a small region of similarity with F-spondin at the N terminus, a stretch of positively charged amino acids at the C terminus, and a series of eight internal repeats of acids at the C terminus, and a series of eight internal repeats of that it flank a pattern of conserved cysteine residues known as an epidermal growth factor (EGF)-like motif. (I) has neuroprotective, concurrent action. (I) is useful in screen for compounds that modulate reelin binding to an LDLR, in an assay system, where the assay system comprises a microplate array and an automated robotic microprocessor controlled system for adding and removing reagents to the microplate array. The compounds identified by the above screening method are useful as therapeutic agents to provide or alleviate a disorders such a stream of the microplate array in a series including neurodegenerative disorders such a stream of the microplate array and an encodes and accorders such a stream of the microplate array and an automated or alleviate and a stream of a series including neurodegenerative disorders such a stream of the series including neurodegenerative disorders such a stream of the series including neurodegenerative disorders such a series including neurodegenerative disorders such a series including neurodegenerative disorders such a series including neurodegenerative and a series diverse spectrum of diseases including neuroueyemeration after as Alzheimer's disease, to facilitate neuronal regeneration after injury, to prevent or alleviate lipid metabolism diseases, to enhance cognitive functions and memory or to ameliorate other developmental disorders. The present invention describes a composition (1) comprising an isolated reelin protein (II) bound to an isolated low density lipoprotein receptor (LDLR) (III). (II) is an extracellular glycoprotein of receptor (LDLR) (III). (II) is an extracellular glycoprotein of approximately 385 kDa containing a small region of similarity with F-spondin at the N terminus, a stretch of positively charged amino acids at the C terminus, and a series of eight internal repeats of 350-390 amino acids, each repeat containing two related sub-domains that flank a pattern of conserved cysteine residues known as an epidermal growth factor (EGF)-like motif. (I) has neuroprotective, nootropic and antilipaemic activities, and can be used as a modulator of reelin-LDLR interaction. (I) is useful in screen for compounds that modulate reelin binding to an LDLR, in an assay system, where the assay system comprises a microplate array and an automated robotic microplate array. The compounds identified by the above screening the microplate array. The compounds identified by the above screening method are useful as therapeutic agents to provide or alleviate a contained as a higherman's diseases including neurodegenerative disorders such as higherman and provide or alleviate and an and an automated and an accident and accident and an accident and accident accident and accident accident and accident and accident accident and accident accident accident and accident poprotein that assay ers such pash s eelin to enhance ಕ್ಷದಕ್ಕ diverse spectrum of diseases including neurodegenerative disorders as Alzheimer's disease, to facilitate neuronal regeneration after injury, to prevent or alleviate lipid metabolism diseases, to enhancegnitive functions and memory or to ameliorate other developmental disorders. The present sequence represents human reelin, which is used in the exemplification of the present invention. coulate Re an isolat modulate ~ Length 3460; Indels Novel composition useful for screening compounds that mo binding to low density lipoprotein receptor, comprising Reelin polypeptide and low density lipoprotein receptor Score 46; DB 23; I Pred. The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular conditions, comprising measuring the expression profile of a genes (I) in a test sample or determining the expression profile of a cample or determining the expression profile of a sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive controllar genes (ABI99202 to ABI99912, encoding expression levels of particular genes (ABI999202 to ABI99912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

polymuciectides are also used in diagnostics as expressed sequence tags for identifying expressed senes. (I) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG0010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.

 The invention comprises the amino acid and coding sequences of two apoptin-associating proteins (AAP-5 and AAP-6). The AAP-5/AAP-6 DNA and protein sequences are useful for inducing p53-independent apoptosis, and the diagnosis/treatment (gene therapy) of cancer and autoimmune diseases. The AAP-5/AAP-6 DNA and protein sequences are also useful for finding additional apoptin-associating proteinaceous substances from the apoptosis pathway cascade. The present amino acid sequence represents the human AAP-5 protein (with a region derived from the multiple cloning site of the pACT expression vector).

CC -!- FUNCTION: Alpha-conotoxins act on postsynaptic membranes, they bind to the nicotinic acetylcholine receptors (nAChR) and thus continue them. The higher affinity site for alpha-conotoxin GI is the alpha/delta site on mouse muscle-deriverd BC3H-1 receptor, and the other site (alpha/gamma site) on nicotinic receptors from continue alectric organ.

CC -!- SUBCELLULAR LOCATION: Secreted.

CC -!- SUBCELLULAR LOCATION: Secreted.

Matsumoto K., Takano H., Kim C.I., Hirokawa H.;

"Primary structure of bacteriophage M2 DNA polymerase: conserved segments within protein-priming DNA polymerases and DNA polymerase I of Escherichia coli.";

of Escherichia coli.";

Gene 84:247-255(1989).

-!- FUNCTION: DNA TERMINAL PROTEIN IS LINKED TO THE 5' ENDS OF THE BOTH STRANDS OF THE GENOME THROUGH A PHOSPHODIESTER BOND BETWEEN THE BETA-HYDROXYL GROUP OF A SERINE RESIDUE AND THE 5'-PHOSPHATE OF THE BETA-HYDROXYL GROUP OF A SERINE RESIDUE AND THE 5'-PHOSPHATE OF THE TERMINAL DEOXYADENYLATE. THIS PROTEIN IS ESSENTIAL FOR DNA REPLICATION AND IS INVOLVED IN THE PRIMING OF DNA ELONGATION.

 This peptide corresponds to amino acid residues 364-378 of human prothrombinase Fg12 (see AAW88235). A claimed method of preventing or treating a condition requiring a reduction in immune coagulation comprises administering an inhibitor of Fg12. The inhibitor is preferably an antibody that binds to the Fg12 epitope. The condition to be treated in graft rejection of foetal loss

Sequences AAU23815-AAU24515 represent the 1C3P2D6-related protein and peptide fragments of the polypeptide. 103P2D6 is not expressed in normal adult tissue but is aberrantly expressed in some foetal tissues and many cancers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6-related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, unine and tissue and to thereby detect the presence of

The present invention describes a peptide (1) comprising an isolated surface exposed group/epitope (E1) of C-epsilon-2 domain (D) of immunoglobulin B (1gE), or its mimotope. Also described are: (1) an immunoglobulin B (1gE), or its mimotope. Also described are: (1) an immunogen (II) for treating allergy comprising (I); (2) a vaccine (II) or treating allergies comprising (I); (3) a ligand (IV) capable of recognising E1; (4) a pharmaceutical composition (PC) comprising (IV); (5) a peptide (Ia) capable of being recognised by (IV); (6) an immunogen (III) by producing (II) (II) and (III) are can have antiallergic and immunosuppressive activities, and can be used as a vaccine and histamine release inhibitor. (I); (II) and (III) are useful in medicine and in the manufacture of medicaments for treating and preventing allergies. (I) is useful in diagnostics and in the affinity purification of circulating anti-IgE antibodies from blood. (I); (III) and PC are useful for treating a patient susceptible to or suffering from allergies. (IV) is also useful in diagnosing atopy. AAB25907 to AAB26099 represent population sequences which are used in the exemplification of the present

The present invention relates to linkage methodology for use in the conjugation of compcunds (e.g. peptides) to carrier vehicles

(e.g. macromolecules, polymers, dendrimers, proteins) to produce

biological and immunological constructs. The invention provides a

method for linking an epitope (e.g. a peptide) to a carrier (e.g. a

protein) for use in a pharmaceutical composition or a vaccine. The

invention describes peptides derived from or mimotopes of the

Cepsilon2, Cepsilon3 or Cepsilon4 regions of human immunoglobulin E

(IgE) which are used to produce conjugated compounds. The compounds or

compositions of the invention are useful in the manufacture of a

medicament for the treatment of IgE mediated diseases. The invention

a llows for controlled conjugation of a peptide epitope (antigen) to a

protein so as to form an immunogenic conjugate which may be able to

raise a protective antibody response in an animal or human patient.

AAU:6632-AAU:6913 represent peptides derived from or mimotopes of

the Cepsilon2/Cepsilon3/Cepsilon4 region of human IgE.

A purified form of cis-9,10-octadecenoamidase (Coase) has been obtained by a chromatographic methodology selected from affinity, electric, gel filtration, ion exchange and partition chromatography. The Coase is characterised by enzymic activity for catalysing the conversion of cis-9,10-octadecenoamide (CO) to oleic acid and by the inclusion of an amino acid sequence fragment from rat liver Coase. The present sequence represents a specifically claimed example of such an amino acid fragment. This fragment is found at residues 31 to 45 of rat liver Coase as shown in AAW10465. The Coase can be used to catalyse the hydrolysis of fatty acid primary amides, which have sleep-inducing activity. The Coase can also be used to identify inhibitors of the
 Fatty acid amide hydrolases (FAAHs) of the invention are characterised by inclusion of an amino acid sequence selected from a group of 28 sequences (see AAW57784-811). These FAAHs can hydrolyse cis-9,10-octadecenoamide, anandamide (arachidoyl ethanolamine), and myristic, palmitic or stearic amides. Also new are: (1) inhibiting hydrolysis of fatty acid primary amides catalysed by FAAH by treatment with an FAAH inhibitor; (2) a method of screening for an

The peptides of the invention are potent inhibitors of synaptic transmission at the neuromuscular junction while lacking inhibition of either nerve or muscle action potential propagation. Their action is freely reversible on dilution or removal of the peptides from the affected muscle. The peptides are useful for reversible immobilisation of a muscle or gp. of muscles in man and other vertebrates and they can be used for detection and measurement of acetylchcline receptors.

(Updated on 16-AUG-2002 to add missing OS field.)

 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
 р
Ц
 CF3CC(CH2)7-CH=CH(cis)-(CH2)7Mel, and (4) nucleic acid encoding or parts of it. FAAH catalyses conversion of fatty acid primary amides, particularly those in which the alkyl group has a cis unsaturation. These amides induce sleep, so FAAH can be used to study processes in which they are involved and also to develop agents for modulating sleep.

Santos AD;

Olivera BM,

The kappa-conotoxin, alpha conotoxin and alpha-like conotoxin peptides all belong to a group of peptides known as the A-lineage conotoxin peptides have a wide variety of pharmacological uses. The A-lineage conotoxin peptides claimed (AAR75264-R75293) are useful for the inhibition of synaptic transmission at neuromuscular junctions by blocking nicotinic acetyl choline receptors and they also have activity against voltage-gated Na and K channels.
